(ABGE-) ABGENIX INC

Gudas J;

WPI; 2003-587113/55. N-PSDB; ADC99802. New human anti-MUC18 monoclonal antibodies, useful for treating a disease or condition associated with expression of MUC18 in a patient, e.g. tumors, cancers, and other malignancies.

Claim 1; SEQ ID NO 29; 78pp; English.

The invention relates to a novel isolated monoclonal antibody comprising a heavy or light chain amino acid or a heavy or light chain variable domain where the antibody binds to MUC18. The monoclonal antibody of the invention demonstrates cytostatic activity and may be useful for treating a disease or condition associated with the expression of MUC18 on the pancreatic or condition two specifically melanoma, oesophageal, pancreatic or colorectal tumours, carcinomas, particularly cervical carcinomas and cervical intraepithelial neoplasia and cancers including colorectal, breast or lung canneer, as well as other malignancies. The current sequence is that of the anti-human MUC18 monoclonal antibody

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a novel monoclonal antibody used for inhibiting tumour growth in an animal. The tumour inhibition process comprises selecting an animal in need of treatment for a tumour, providing a menoclonal antibody comprising a heavy chain amino acid, where the monoclonal antibody comprising a heavy chain amino acid, where the antibody consists of any one of 10 fully defined sequences of 117-123 amino acids given in the specification, and where the monoclonal antibody binds MUC18, and contacting the tumour with the antibody resulting in inhibited proliferation of the cells. The monoclonal antibody has cytostatic and can be used in the production of a vaccine. The monoclonal antibodies against the MUC18 antigen are useful for diagnosing and treating tumours, inhibiting tumour growth (e.g. melanoma, lung tumour or tumour metastasis), inhibiting cell invasion associated with melanoma, or increasing survival of an animal having a metastatic tumour. This sequence represents an anti-MUC18 antibody heavy chain, variable region,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention comprises a method for inhibiting cell proliferation associated with expression of MUC18 tumour antigen. The method involves administering anti-MUC18 monoclonal antibody. The method of the invention is useful for inhibiting cell (e.g. melanoma or tumour cell) proliferation associated with the expression of MUC18 tumour antigen, the method is preferably useful for inhibiting tumour metastasis. The method is useful for inhibiting cell proliferation in patients with tumours, carcinomas, cancer and other malignancies. The present amino acid sequence represents a heavy chain from an MUC18 tumour antigen-specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ADSVKGRFTISRDNSKNTLYLQMNSLRAEDTAVYYCARSIFGVVIDYGMDVWGQGTTVTV 120

the pharmaceutical composition comprising a therapeutic amount of the above antibody or antibody fragment, and a pharmaceutical excipient; (4) a pharmaceutical composition comprising a therapeutic amount of the above antibody or antibody fragment, and a pharmaceutical excipient; (4) an isolated and purified equence, and their fragments, romplements and degenerate codon equivalents; and (5) an isolated and purified amino acid sequence, and their fragments. The Epo receptor binding antibody has antianaemic, neuroprotective and vulnerary activities, and can be used in gene therapy. The compositions and methods from the present invention can be used for modulating an endogenous activity of a human EPO receptor or for treating mammals suffering from aplasia or anaemia. They may also be used for identifying mammals having a dystunctional EPO receptor. The composition may also be used in promoting wound healing or in protecting against neural cell and/or tissue damage resulting from brain/spinal cord injury, stroke and the like. The present sequence represents a human anti-EPO-R antibody heavy chain variable region, which is given in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes an antibody or its fragment that binds to or activates an endogenous activity of a human erythropoietin (BPO) receptor in a mammal, but does not interact with a peptide having a sequence of 30 amino acids (SEQ ID NO:1, ADS84362). Also described: (1) methods of modulating or activating an endogenous activity of a human EPO receptor in a mammal, comprising administering to the mammal a therapeutic amount of the above antibody or its fragment to modulate or activate the receptor; (2) a method of treating a mammal suffering from aplasia, comprising administering to the mammal a therapeutic amount of the above antibody or its fragment to modulate or activate the receptor;
                                                                                                                                                                                                                                                    erythropoietin receptor binding antibody; EPO receptor binding antibody, antianaemic; neuroprotective; vulnerary; gene therapy; aplasia; anaemia; wound healing; neural call damage protection; neural tissue damage protection; brain injury; spinal cord injury; stroke; anti-erythropoietin receptor antibody; anti-EPO-R antibody.
                                                                                                                                                                                     Human anti-BPO-R antibody heavy chain variable region SEQ ID NO:11
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New antibodies that bind to or activate an endogenous human erythropoietin receptor, useful for diagnosing, preventing or tre disorders associated with dysfunctional erythropoietin receptor,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Wieler J;

Also described are: a method of activating or modulating an endogenous activity of a human erythropoietin receptor in a mammal; a pharmaceutical composition comprising a therapeutic amount of an antibody rangined the approach and pharmaceutical excipient; an isolated and purified polymucleotide sequence selected from 28 sequences comprising 322-370 bp (even SEQ ID NOs between SEQ ID NO: 2-56) given in
                                                                                                                                                                  61 ADSVKGRFTISRDNSKNTLYLQMNSLRVEDTAVYYCARDHGGRYVYDYGMDVWGQGTTVT 120

equivalents; and an isolated and purified amino acid sequence selected from 39 sequences comprising 27-552 amino acids (add SEQ ID NOs between SEQ ID NO: 3-57, and SEQ ID NO: 58-68) given in the specification or modulates the antibody or its antibody fragment that activates or modulates the activity of the receptor is useful in a method of treating a mammal suffering aplasia or anaemia. The antibodies are also useful for treating disorders characterised by decreased or subnormal levels of oxygen in the blood or tissue such as hypoxaemia or chronic tissue hypoxia and/or diseases characterised by inadequate blood circulation or reduced blood flow. They are also useful for promoting wound healing or for protecting against neural cell and/or tissue damage, resulting from brain/spinal cord mijury, stroke and the like. The antibodies are also useful for identifying or diagnosing mammals having dysfunctional errythropoletin receptor. This is the amino acid sequence of an anti-EPO-R
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     61 ADSVKGRFTISRDNSKNTLYLQMNSLRVEDTAVYYCARDHGGRYVYDYGMDVMGQGTTVT 120

The present invention describes an antibody or its fragment that binds to or activates an endogenous activity of a human erythropoietin (BPO) areceptor in a mammal, but does not interact with a peptide having a creceptor in a mammal, but does not interact with a peptide having a creceptor in a mammal. Onc:, ADSB4362). Also described: (1) methods of modulating or activating an endogenous activity of a human BPO creceptor in a mammal. Comprising administering to the mammal a creceptor; (2) a method of treating a mammal suffering from aplasia, comprising administering to the mammal a therapeutic amount of the above antibody or its fragment to modulate or activate the receptor; (3) a pharmaceutical composition comprising a therapeutic amount of the above antibody or its fragment, and a pharmaceutical excipient; (4) a nisolated and purified polyuncleotide sequence, and their fragments, complements and degenerate codon equivalents; and (5) an isolated and purified polyuncleotide sequence, and their fragments. The BPO receptor building antibody has antianemic, neuroprotective and vulnerary activities, and can be used in gene therapy. The compositions and methods from the present invention can be used for identifying mammals having a dysfunctional BPO receptor or for treating mammals suffering from aplasia or anaemia. They may also be used for identifying mammals having a cetivity of a human BPO receptor or for treating mammals enfering and the composition may also be used in compassion may also be used in the present sequence represents a human anti-BPO-R antibody heavy compassion may also be used in the exemplification of the present sequence represents a human anti-BPO-R antibody heavy compassion in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              61 ADSVKGRFTISRDNSKNTLYLOMNSLRAEDTAVYYCARSIFG-VVIDYGMDVWGQGTTVT 119

The invention describes an antibody or its fragment that activates an endogenous activity or capable of binding to a human erythropoietin receptor in a mammal, or that comprises at least one heavy or light chain covariable region having a sequence comprising 116 or 107 amino acids (SEQ ID NO: 3 or 5) given in the specification or its fragment, but does not interact with a peptide comprising 30 amino acids (SEQ ID NO: 1) also given in the specification. Also described are: a method of activating or modulating an endogenous activity of a human erythropoietin receptor in a modulating an endogenous activity of a human erythropoietin receptor in a manmal; a pharmaceutical composition comprising a therapeutic amount of an antibody or antibody fragment above and a pharmaceutical excipient; and an antibody or antibody fragment above and a pharmaceutical excipient; and an antibody or antibody fragment above selected from 28 sequences comprising 32-370 bp (even SEQ ID NOs between SEQ ID NO: 2-56) given in the specification, and their fragments, complements, and degenerace coden (equivalents; and an isolated and purified amino acid sequence selected from 35 sequences comprising 27-552 amino acids (odd SEQ ID NO: 55-68) given in the specification or their fragments. The antibody fragment that activates or modulates the activity of the receptor is useful in a method of treating a longerers characterised by decreased or subnormal levels of oxygen in the blood or tissue such as hypoxaemia or chronic tissue cure treating disorders characterised by inadequate blood circulation or reduced blood flow. They are also useful for pronormal levels are also useful for identifying or diagnosing mammals having dysfunctional erythropoietin receptor. This is the amino acid sequence of an anti-EPO-R
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New antibody or its antibody fragment that activates an endogenous activity or is capable of binding to a human erythropoietin receptor in a mammal, useful for treating a mammal suffering aplasia or anemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                              Wieler J;

activities, and can be used in gene therapy. The compositions and methods from the present invention can be used for modulating an endogenous activity of a human BPO receptor or for treating mammals suffering from applasta or anaemia. They may also be used for identifying mammals from a dysfunctional BPO receptor. The composition may also be used in promoting wound healing or in protecting against neural cell and/or tissue damage resulting from brain/spinal cord injury, stroke and the

tissue damage resulting from brain/spinal cord injury, stroke and the like. The present sequence represents a human anti-EPO-R antibody heavy chain variable region, which is given in the exemplification of the

present invention Sequence 123 AA;

chain

```
The present invention describes an antibody or its fragment that binds to activates an endogenous activity of a human erythropoietin (BPO)

Creceptor in a mammal, but does not interact with a peptide having a sequence of 30 antino activating an endogenous activity of a human BPO receptor in a mammal, comprising administering to the mammal a therapeutic amount of the above antibody or its fragment to modulate or activate the receptor; (2) a method of treating a mammal suffering from aplasia, comprising administering to the mammal a therapeutic amount of the above antibody or its fragment to modulate or activate the receptor; (3) a pharmaceutical composition comprising a therapeutic amount of the above antibody or antibody fragment, and a pharmaceutical excipient; (4) an isolated and degenerate codon equivalents; and (5) an isolated and codo sequence, and their fragments, complements and degenerate codon equivalents; and (5) an isolated and purified amino acid sequence, and their fragments. The BPO receptor binding antibody has antianaemic, neuroprotective and vulnerary
                                                                                                                           human; erythropoietin receptor; EPO receptor; erythropoietin receptor binding antibody; erythropoietin receptor binding antibody; erythropoietin receptor binding antibody; antianaemic; neuroprotective; vulnerary; gene therapy; aplasia; anaemia; wound healing; neural cell damage protection; neural tissue damage protection; brain injury; spinal cord injury; stroke; anti-erythropoietin receptor antibody; anti-EPO-R antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New antibodies that bind to or activate an endogenous human erythropoietin receptor, useful for diagnosing, preventing or treating disorders associated with dysfunctional erythropoietin receptor, e.g.
                                                                                          Human anti-EPO-R antibody heavy chain variable region SEQ ID NO:15.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes an antibody or its fragment that binds to or activates an endogenous activity of a human erythropoletin (EPO)

Cor activates an endogenous activity of a human erythropoletin (EPO)

Cor ecceptor in a mammal, but does not interact with a peptide having a sequence of 30 amino acids (ESO ID NO:1, ADS84362). Also described: (1)

methods of modulating or activating an endogenous activity of a human EPO creceptor in a mammal, comprising administering to the mammal a creceptor; (2) a method of treating a mammal suffering from activate the receptor; (2) a method of treating a mammal suffering from aplasia, comprising administering to the mammal a therapeutic amount of the above antibody or its fragment to modulate or activate the receptor; (3) a pharmaceutical composition comprising a therapeutic amount of the above antibody or antibody fragment, and a pharmaceutical excipient; (4) a plasmaceutical composition comprising a therapeutic amount of the above antibody or antibody fragment, and a pharmaceutical excipient; (4) complements and degenerate codon equivalents; and (5) an isolated and composition and their fragments. Complements and degenerate codon equivalents; and (5) an isolated and compositions and methods from the present invention can be used for modulating an endogenous activity of a human EPO receptor or for treating mammals suffering from

cc receptor in a mammal, or that comprises at least one heavy or light chain variable region having a sequence comprising 116 or 107 amino acids (SEQ ID No: 3 or 5) given in the specification or its fragment, but does not interact with a peptide comprising 30 amino acids (SEQ ID No: 1) also given in the specification. Also described are: a method of activating or modulating an endogenous activity of a human erythropoietin receptor in a mammal; a pharmaceutical composition comprising a therapeutic amount of an antibody or antibody fragment above and a pharmaceutical excipient, and mammal; a pharmaceutical composition comprising a therapeutic amount of an antibody or antibody fragment above and a pharmaceutical excipient, and mammal; a pharmaceutical excipient, and mammal; a pharmaceutical excipient, and an isolated and purified amino acid sequences comprising 322-370 bp (even SEQ ID Nos between SEQ ID No: 2-56) given in the specification or comprising 27-552 amino acid sequence selected from 3-57, and SEQ ID No: 58-68) given in the specification or complements; and an isolated and purified amino acid sequence selected from 3-57, and SEQ ID No: 58-68) given in the specification or mammal suffering aplasia or ansemia. The antibodies are also useful for treating disorders characterised by decreased or subnormal levels of oxygen in the blood or tissue such as hypoxaemia or chronic tissue changes, resulting from the protecting against neural cell and/or tissue damage, resulting from brain/spinal cord injury, stroke and the like. The antibodies are also useful for promoting wound healing or expincypoletin receptor. This is the amino acid sequence of an anti-EPO-R antibody when we thin variable residence when the mino acid sequence of an anti-EPO-R antibody when we thin variable residence. antibody heavy chain variable region. %\$GGGGGGGGGGGGGGGGGGGGGGGGGG

```
The invention describes an antibody or its fragment that activates an endogenous activity or capable of binding to a human erythropoietin candogenous activity or capable of binding to a human erythropoietin cemperator in a mammal, or that comprises at least one heavy or light chain variable region having a sequence comprising 116 or 107 amino acids (SEQ ID NO: 3 or 5) given in the specification or its fragment, but does not interact with a peptide comprising 30 amino acids (SEQ ID NO: 1) also carriated in the specification. Also described are: a method of activating or modulating an endogenous activity of a human erythropoietin receptor in a martibody or antibody fragment above and a pharmaceutical excipient; an isolated and purified polynuclectide sequence selected from 28 sequences comprising 322-370 bp (even SEQ ID NOs between SEQ ID NOs 2-56) given in the specification, and their fragments, complements, and degenerate codon equivalents; and an isolated and purified amino acids sequence selected from 39 sequences comprising 27-55 amino acids sequence selected from 55 from 39 sequences comprising 27-55 amino acids (add SEQ ID NOs 3-57, and SEQ ID NO: 58-68) given in the specification or their fragments. The antibody or its antibody fragment that activates or modulates the activity of the receptor is useful in a method of treating a mammal suffering aplasia or anamia. The antibodies are also useful for the receptor is useful in a method of treating carments and an anamal suffering aplasia or anamia. The antibodies are also useful for the receptor is useful in a sequence of the receptor is useful in a method of treating aplasia or anamia. The antibodies are also useful for the receptor is useful in the specification or the receptor is useful in a method of treating the receptor is useful in a method of treating and an anamal suffering aplasia or anamial.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       oxygen in the blood or tissue such as hypoxaemia or chronic tissue thypoxia and/or diseases characterised by inadequate blood circulation or reduced blood flow. They are also useful for promoting wound healing or for protecting against neural cell and/or tissue damage, resulting from brain/spinal cord injury, stroke and the like. The antibodies are also useful for identifying or diagnosling mammals having dystunctional erythropoietin receptor. This is the amino acid sequence of an anti-EPO-R antibody heavy chain variable region.
                                                                                                                                                                                                                                                                                                                                 New antibody or its antibody fragment that activates an endogenous activity or is capable of binding to a human erythropoietin receptor in a mammal, useful for treating a mammal suffering aplasia or anemia.

The present sequence is that of a human DP-46 heavy chain variable region encoded by a human germline DP-46 gene in a transgenic mouse used in human monoclonal antibody (mab) construction. A Gentry fusion was performed using spleen cells from a hybrid mouse containing human variable and constant region antibody transgenes that was immunised with recombinant human tumour necrosis factor (TMF) alpha. Human makes were obtained that bound immobilised human TgG1, kappa isotype. Their heavy chain variable region deduced amino acid sequences (see AMMS1168-72) showed high similarity to the DP-46 sequence. The invention provides isolated human, primate, rodent, mammalian, chimeric, humanised and/or complementarity determining region (CDR)-grafted anti-TMF antibody compositions, encoding or complementary nucleic acids, vectors, immunoglobulins, and cleavage products and variants, as well as anti-TMF antibody compositions, formulations, devices, transgenic animals, cransgenic plants, and methods of making and using them. The anti-TMF antibody comprises at least a portion of an immunoglobulin molecule, especially the heavy chain and/or light chain variable regions given in the present sequence and in AMMS1165, or either all of the CDRs of the heavy chain (see AMMS118-60) or all of the CDRs of the heavy chain (see AMMS118-60) or all of the CDRs of the heavy chain (see AMMS118-60) or all of the CDRs of the heavy chain (see AMMS118-60) or all of the CDRs of the heavy chain and inhibit TMP-induced cell and in the composition. heavy chain (see AAM51158-60) or all of the CDRs of the light chain (se AAM51161-63). The antibodies may inhibit TNF-induced cell adhesion molecules, inhibit TNF binding to receptor, or provide Arthritic Index

```
The invention relates to an antibody or its antigen-binding fragment which specifically binds to epitope on prostate specific membrane antigen (SPMA), and competitively inhibits the specific binding of a second antibody to its target epitope on PSMA. The invention is useful for diagnosing, treating or preventing PSMA-mediated disease such as prostate
                                                                                                                                                                                                                                                                                                                                                                                                                            120
                                                                                                                                                                                                                                                                                                                                                                                                                                                    in a mouse model. transitional cell carcinoma, panoreatic cancer including panoreatic duct carcinoma, lung carcinoma, ricluding non-small cell lung carcinoma, kidney carcinoma, lung carcinoma, kidney carcinoma, lung carcinoma, kidney cancer including conventional renal cell carcinoma, sarcoma including soft tissue sarcoma, breat cancer including glioblastoma multiforme, neuroendocrine carcinoma, colon cancer including glioblastoma multiforme, neuroendocrine carcinoma, colon testicular embryonal carcinoma, or melanoma including malignant melanoma. The invention is useful also for inhibiting or enhancing folate hydrolase activity of a NAALADase polypeptide alpha-linked acidic dipeptidase (NAALADase) activity of a NAALADase polypeptide, dipeptidase IV activity of a dipeptidy dipeptidase IV activity of a dipeptidy dipeptide, panama-glutamyl hydrolase activity of a gamma-glutamyl hydrolase activity of a gamma-glutamyl hydrolase polypeptide. The present sequence is human PSNA antibody heavy chain variable region (VH)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        anti-TNFa antibody; anabolic; antiarteriosolerotic; antiarthritic; antiboterial; antiarthritic; antiboterial; antiarthritic; eating-disorder; antiarthritic; eating-disorder; immunomodulator; immunosuppressive; nephrotropic; neuroprotective; vasotropic; antiapoptotic; TNFa antagonist; TNF induced apoptosis; neoplastic disease; breast cancer; ovarian cancer; bladder cancer; lung cancer; glioblastoma; stomach cancer; endometrial cancer; immuno-mediated inflammatory disease; prostrate cancer; immuno-mediated inflammatory disease; restenosis; autoimmune disease; Crobn's disease; graft-host reaction; septic shock; cachexia; anorexia; multiple sclerosis.

The invention relates to a human monoclonal antibody that binds to platelet-derived growth factor-D (PDGF-D). The antibodies are useful for treating chronic and recurrent human diseases, such as inflammation, autoimmunity and cancer. The PDGF-D nucleic acids and polypeptides are useful for modulating collagen formation, and for staging various cancers. Antibodies to platelet-derived growth factor-D (PDGF-D) were generated using an active protein fragment of the gene product from the clone 30664188.0.99 arising in the conditioned medium obtained when HEKZ93 cells are transfected with the plasmid pCEP4/Sec-30664188. This sequence corresponds to a protein used in the invention.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 46, Sequence 46, Sequence 46, Sequence 46, Sequence 2, 8 Sequence 2, Sequence 26, Sequence 26, Sequence 16, Sequence 16, Sequence 16, Sequence 16, Sequence 11, Seque

C;Species: Homo sapiens (man)
C;Species: Homo sapiens (man)
C;Date: 27-Jan-1995 #sequence_revision 27-Jan-1995 #text_change 20-Jun-2000
C;Accession: 846392
R;Figini, M; Marks, J.D.; Winter, G.; Griffiths, A.D.
A;Title: In vitro assembly of repertoires of antibody chains on the surface of phage by A;Reference number: 846392
A;Accession: 846392
A;Accession: 846392
A;Accession: Preliminary
A;Molecule type: DNA
A;Residues: 1-114 <FIG.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        C, Accession: 831601

New human anti-MUC18 monoclonal antibodies, useful for treating a disease or condition associated with expression of MUC18 in a patient, e.g. tumors, cancers, and other malignancies.

Claim 1; SEQ ID NO 33; 78pp; English.

The invention relates to a novel isolated monoclonal antibody comprising a heavy or light chain amino acid or a heavy or light chain variable domain where the antibody binds to MUC18. The monoclonal antibody of the invention demonstrates cytostatic activity and may be useful for treating a disease or condition associated with the expression of MUC18 on the pancreatic or condition tumours, specifically melanoma, ossophageal, pancreatic or colorectal tumours, carcinomas, particularly cervical carcinomas and cervical intraepithelial neoplasia and cancers including colorectal, breast or lung cannoer, as well as other malignancies. The current sequence is that of the anti-human MUC18 monoclonal antibody

 The invention relates to a novel monoclonal antibody used for inhibiting tumour growth in an animal. The tumour inhibition process comprises selecting an animal in need of treatment for a tumour, providing a monoclonal antibody comprising a heavy chain amino acid, where the monoclonal antibody consists of any one of 10 fully defined sequences of 117-123 amino acids given in the specification, and where the monoclonal antibody binds MUC18, and contacting the tumour with the antibody resulting in inhibited proliferation of the cells. The monoclonal antibody has orycestatic and can be used in the production of a vaccine. The monoclonal antibodies against the MUC18 antigen are useful for diagnosing and treating tumours, inhibiting cumour growth (e.g. melanoma, lung tumour or tumour metasteasis), inhibiting cell invasion associated with melanoma, or increasing survival of an animal having a metastatic tumour. This sequence represents an anti-MUC18 antibody heavy chain, variable region,

 The invention comprises a method for inhibiting cell proliferation associated with expression of MUC18 tumour antigen. The method involves administering anti-MUC18 monoclonal antibody. The method of the invention is useful for inhibiting cell (e.g. melanoma or tumour cell) proliferation associated with the expression of MUC18 tumour antigen, the method is preferably useful for inhibiting tumour metastasis. The method is useful for inhibiting cell proliferation in patients with tumours, carcinomas, cancer and other malignancies. The present amino acid sequence represents a heavy chain from an MUC18 tumour antigen-specific

```
The invention relates to a novel isolated monoclonal antibody comprising a heavy or light chain amino acid or a heavy or light chain variable domain where the antibody binds too MUC18. The monoclonal antibody of the invention demonstrates cytostatic activity and may be useful for treating a disease or condition associated with the expression of MUC18 on the cell surface such as tumnours, specifically melanoma, oseophageal, pancreatic or colorectal tumnours, carcinomas, particularly cervical carcinomas and cervical intraepithelial neoplasia and cancers including colorectal, breast or lung cancer, as well as other malignancies. The current sequence is that of the anti-human MUC18 monoclonal antibody heavy chain protein of the invention.

 The invention relates to a novel monoclonal antibody used for inhibiting tumour growth in an animal. The tumour inhibition process comprises selecting an animal in need of treatment for a tumour, providing a monoclonal antibody comprising a heavy chain amino acid, where the antibody consists of any one of 10 fully defined sequences of 117-123 amino acids given in the specification, and where the monoclonal antibody binds WGC18, and contacting the tumour with the antibody resulting in inhibited proliferation of the cells. The monoclonal antibody mas cytostatic and can be used in the production of a vaccine. The monoclonal antibodies against the WGC18 antigen are useful for diagnosing and treating tumours, inhibiting cell invasion associated with melanoma, or tumour metastasis), inhibiting cell invasion associated with melanoma, or increasing survival of an animal having a metastatic tumour. This sequence represents an anti-WGC18 antibody heavy chain, variable region,

colorectal neoplasms, colorectal tumors, cervical carcinoma, cervical intraepithelial squamous and glandular neoplasia or esophageal tumors. New anti-CA IX monoclonal antibody, useful for treating a tumor e.g.

Example 2; SEQ ID NO 138; 89pp; English.

The invention relates to a novel isolated monoclonal antibody (mAb) comprising a heavy chain polypeptide and light chain polypeptide having a sequence chosen from one of 53 fully defined anino acid sequences given in the specification, where the antibody specifically binds carbonic anhydrase IX (GA IX) tumour antigen. The antibody of the invention demonstrates cytostatic activity and may be useful for treating a tumour,

transgenic mouse strain.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a novel isolated monoclonal antibody (mab) comprising a heavy chain polypeptide and light chain polypeptide having sequence chosen from one of 53 fully defined amino acid sequences given in the specification, where the antibody specifically binds carbonic anhydrase IX (CA IX) tumour antigen. The antibody of the invention demonstrates cytostatic activity and may be useful for treating a tumour, such as colorectal neoplasm, renal cell carcinoma, cervical carcinoma, cervical intraepithelial squamous and glandular neoplasia, osesophageal tumour or breast cancer, possibly via gene therapy. The current sequence is that of a murine-expressed anti-human CA IX monoclonal antibody WH (heavy chain variable domain) protein of the invention. The protein was generated via the introduction of the human CA IX protein into
              cervical intraepithelial squamous and glandular neoplasia, oesophageal tumour or breast cancer, possibly via gene therapy. monoclonal antibody; carbonic anhydrase IX; CA IX tumour antigen; cytostatic; colorectal neoplasm; renal cell carcinoma; cervical intraepithelial squamous neoplasia; cervical intraepithelial glandilar neoplasia; oesophageal; breast cancer; gene therapy; murine; mouse; human; heavy chain variable domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a novel isolated monoclonal antibody (mAb) comprising a heavy chain polypeptide and light chain polypeptide having a sequence chosen from one of 53 fully defined amino acid sequences given in the specification, where the antibody specifically binds carbonic anhydrase IX (CA IX) tumour antigen. The antibody of the invention demonstrates cytostatic activity and may be useful for treating a tumour, such as colorectal neoplasm, renal cell carcinoma, cervical intraepithelial squamous and glandular neoplasia, osesophageal tumour or breast cancer, possibly via gene therapy. The current sequence is that of a murine-expressed anti-human CA IX monoclonal antibody VH (heavy chain variable domain) protein of the invention. The protein was generated via the introduction of the human CA IX protein into

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a novel isolated monoclonal antibody (mAb) comprising a heavy chain polypeptide and light chain polypeptide having a sequence chosen from one of 53 fully defined amino acid sequences given in the specification, where the antibody specifically binds carbonic anhydrase IX (CA IX) tumour antigen. The antibody of the invention demonstrates cytostatic activity and may be useful for treating a tumour, such as coloractal neoplasm, renal cell carcinoma, cervical intraspithellal squamous and glandular neoplasia, oseophaggal tumour or breast cancer, possibly via gene therapy. The current sequence is that of a murine-expressed anti-human CA IX monoclonal antibody VH (heavy chain variable domain) protein of the invention. The protein was generated via the introduction of the human CA IX protein into a

The antibody of the invention demonstrates cytostatic activity and may be useful for treating a tumour, such as colorectal nooplasm, renal cell carcinoma, cervical intraepithelial squamous and glandular neoplasia, oesophageal tumour or breast cancer, possibly via gene therapy. The current sequence is that of a murine-expressed anti-human CA IX monoclonal antibody WH (heavy chain variable domain) protein of the invention. The protein was generated via the introduction of the human CA IX protein into

These can be used in diagnosis and therapy of HIV-1 infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             61

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 39,

Patent No. 6828422

GENERAL INFORMATION:

APPLICANT: Knappik, Achim
Pack, Peter

Ilaq, Vic

Ge, Liming
Moroney, Simon
Plueckthun, Andreas

TITLE OF INVENTION: Protein/(Poly) peptide libraries
